CartNest September 2026 reconciliation: assumptions

Where the data or the brief was unclear, these are the choices made. All figures in the workbook follow them.

Cleaning the data

1. **Dates.** Order dates come in three formats (dd-mm-yyyy, dd/mm/yyyy, yyyy-mm-dd) and are read day-first. Every date then falls between 1 and 30 September 2026, which supports this reading.
2. **Order references.** Gateway references are cleaned to the form ORD plus 8 digits: made upper case, with hyphens and spaces removed.
3. **Refunds.** Refund rows carry no order reference, so each is linked to its order through original_payment_id, to the original capture, to the order.
4. **Duplicate rows.** 10 gateway rows with the same pg_txn_id and identical values (₹25,386 gross, ₹25,162.89 net) are treated as export duplicates and removed; they are kept in a separate sheet. After removal, 26 of the 27 batches that have a bank credit match it to the paisa. These differ from the 6 real duplicate charges (different pg_txn_id, same order), which stay in the data.
5. **Amounts and cities.** Order amounts stored with commas are converted to numbers. The 180 blank cities are set to "Unknown" and the orders are kept, since city is not used in matching.

Definitions

6. **Sales** means Paid plus Refunded orders (₹1,98,94,293). Failed and Cancelled orders are not sales. Refunded orders were sold and paid, so the refund appears as its own line in the bridge.
7. **Cash received** means the 27 PAYGATE settlement credits (₹1,69,84,048.56). The COD remittance and marketplace payout credits (₹2,07,300.55) and all debits are not gateway money and are left out of the match.
8. **Settlement batches** are matched to the bank by the batch ID in the narration. A batch is Matched when amounts agree, Short-paid when the bank is lower, Missing when the bank has no credit, and Due in October when it settles after 30 September, because the statement ends on that date. Refunds are deducted inside the batch in which they settle.

Fees (MDR and GST)

9. **Rate card.** The percentages are read as written (1.8 means 1.8%). A slab includes its upper limit and excludes its lower limit, so a payment of exactly ₹2,000 falls in the lower slab. No payment is exactly ₹2,000 or ₹10,000, so this changes no result.
10. **Rounding.** Expected MDR is gross times rate, rounded half up to 2 decimals, which is how the gateway rounds. Expected GST is 18% of that MDR, also rounded to 2 decimals.
11. **Overcharge** is the MDR plus GST charged, less the correct MDR plus correct GST. Any extra GST arises only because the MDR was too high. No payment was undercharged.

Matching orders to the gateway

12. **Exception types.** Each order is given one label, checked in this order: paid with no payment, payment on a Failed or Cancelled order, duplicate charge (more than one capture), amount difference (one capture that differs from the order), refunded with no refund, refund on an order not marked Refunded, refund amount differs.
13. **Values.** A duplicate charge is valued at the extra amount charged. An amount difference is the gateway amount less the order amount. A payment with no order is valued at its gross amount.
14. **The bridge** runs from sales to cash in the bank, one line per difference, and ends with ₹0 unexplained. Positive lines add cash and negative lines remove it.

Presentation

15. Amounts are in rupees to the paise where they have paise, in Indian digit grouping. The workbook uses live formulas and no links to other files.
